[Notes]

- [All text within square brackets are developer instructions. They must not be visible to the end user.
- Whenever there is AI-user interaction, the AI avatar should change state (colour, shape, pulsation)
- When the AI is thinking, the following should be displayed, it should fade in and out to provide visual feedback **(❇ thinking…).**
- Content windows need to be larger on desktop. They should occupy 80-90% of browser window real estate. They're too small and the content barely fits. Ensure the size is normalised across the whole deck
- The user should be able to ask the AI questions about the content. this means that the AI will need access to it. You could simply give the AI access to XML descriptions of each slide's content and the ability to track current progress
- The user should be able to skip ahead to any point they choose. Provide a contents menu to facilitate this. Divide the deck into sections (don't include every individual slide. Group them into sections and provide a learning aim for each section)
- Slides need to have a clear, consistent visual heierarchy and every slide must have an image
- All user-chatbot communication should be saved and RAG used to ensure the chatbot can ground the lesson in the user's experience.
- Display timings wherever they are given
- The AI system prompt for the assessment chatbot and slide deck are different. Reference….. For the slide deck system prompt

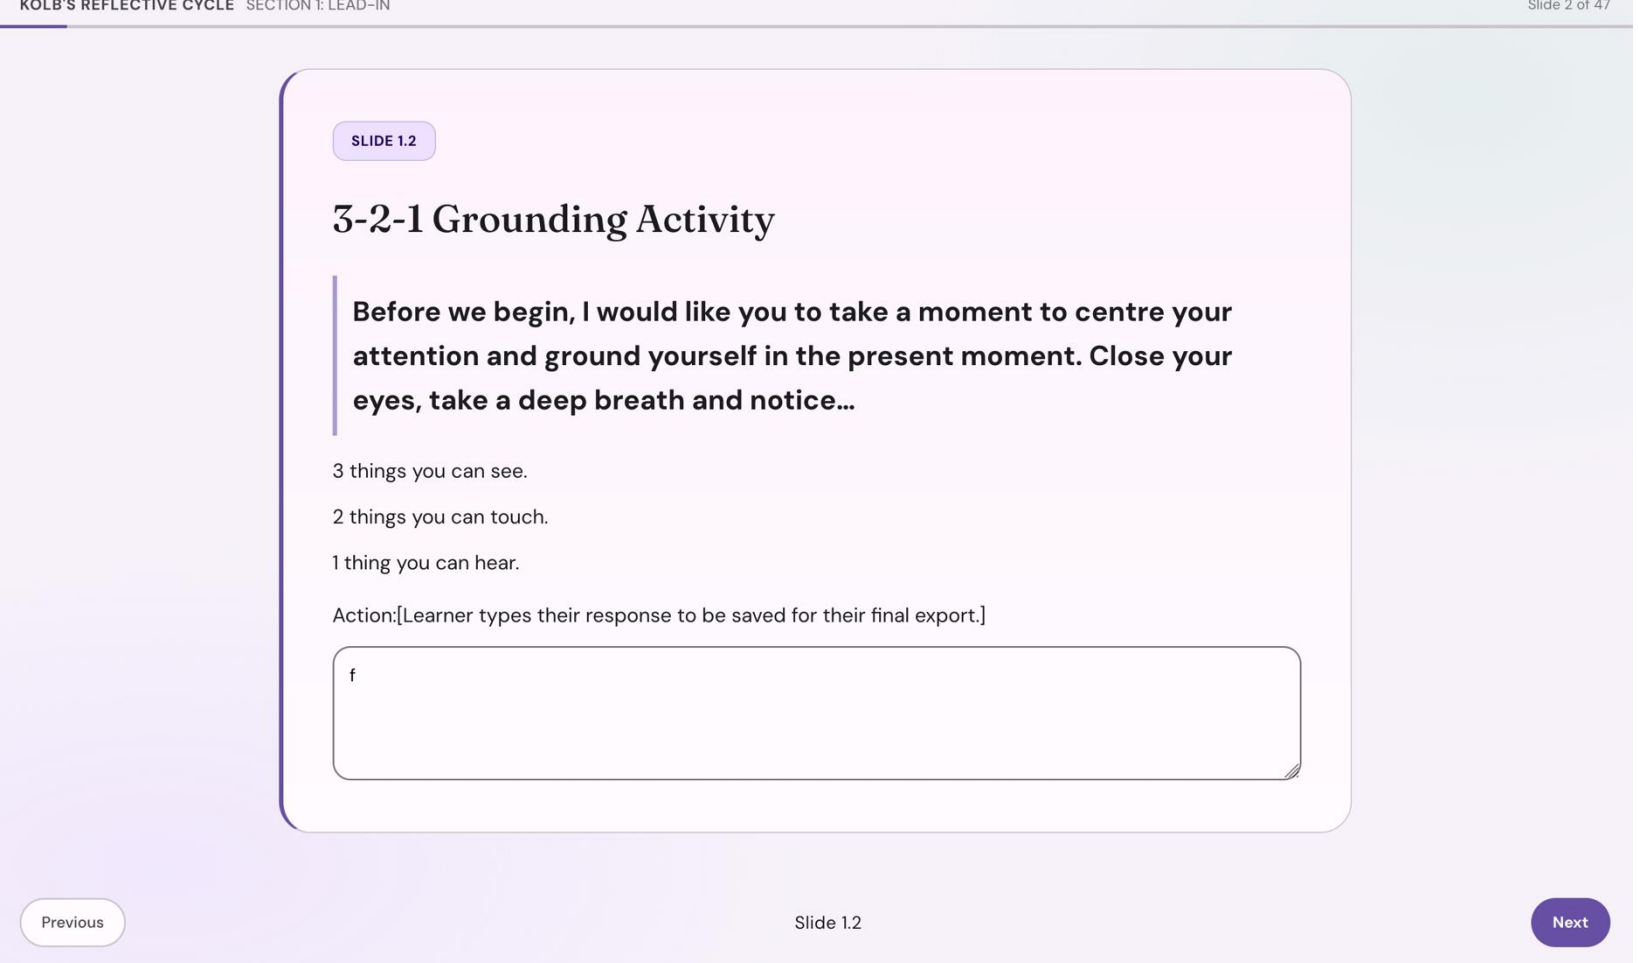
H1 Title: Introduction to Kolb’s Reflective Learning Cycle

(use a Glassmorphism effect for this content panel)

images/title_background_image.jpg



Each number needs to have a corresponding Google Materials icon.

The sense verbs need to be a different colour

Remove the developer comments

There should be a send button. Make an API call to Gemini 3.1 pro.

Use images/grounding_activity_background.jpg as a background image, use a glass/transparency effect for the content window

The AI should respond to the user input. You'll need to create a space for the AI's response

There is no API key entry so the AI features are non functional`

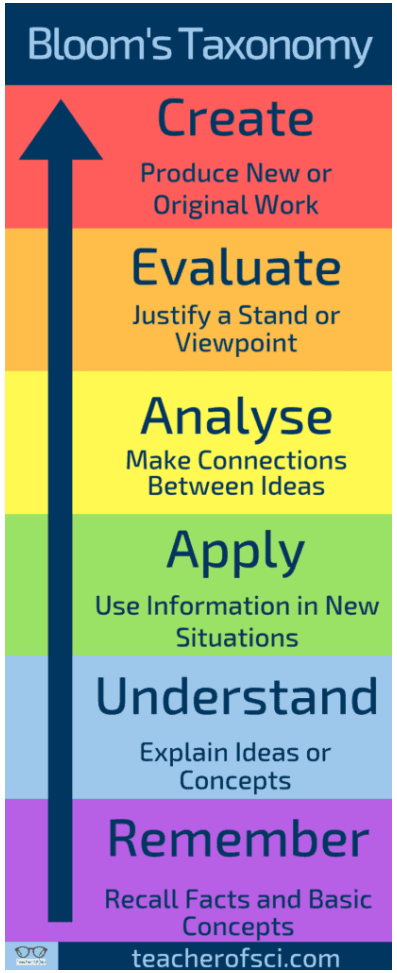
1

SLIDE 1.1

Welcome to your asynchronous session on Kolb's Reflective Cycle.

> **In today's session, you are going to progress through three stages of learning:**

- Understand the basic underlying principles of Kolb's reflective learning cycle
- Apply these principles to a critical incident
- Evaluate an example of deep systematic reflection
- Create your own systematic reflection on a critical incident



avatar

Remove the text: "Bottom to Top"

Remove the verbs in square brackets

Represent the ILOs in a graphic like this

Question Short answer: Which of these ILOs appeals to you the most?

0.3

avatar

When you joined, we discussed your Myers Briggs personality type. Do you remember your personality type?
If not, you can take this 16 personality test now and I will adapt my communication style in response.

The slide deck needs to skip the sections the learner omits

avatar

You can choose your own pathway through these materials. We recommend spending 20 minutes.

User can select a pathway

1. Evaluating Reflective Writing 10 Reflective Writing t 10
2. Kolb's Experiential Learning 10 Reflective Writing t 10

3. Kolb's Experiential Learning Cycle 10 Evaluating Reflective Writing 10
4. Evaluating Reflective Writing 10 Kolb's Experiential Learning Cycle 10
5. Evaluating Reflective Writing 20
6. Kolb's Experiential Learning Cycle 20

H1 Title: Kolb’s Experiential Learning Cycle

(use a Glassmorphism effect for this content panel)

images/title_background_image.jpg

avatar

H1: Using your experience for learning

In Module 1: Returning to social work we asked you to reflect on a critical incident so you could understand a little more about how you approach your practice and your learning needs. This is called experiential learning, and is a way of approaching the reflective cycle. Let’s go through your critical incident again, briefly.

[AI RESPONSE]

[USER INPUT]

avatar

[Padlet embed] Display a ‘copy text’ button so they can copy it into the Padlet

Feel free to share your experience with your peers. If an experience resonates with you, leave a comment.

<iframe src="https://padlet.com/embed/burwiwhbdqhr2f9n" frameborder="0" allow="camera;microphone;geolocation;display-capture;clipboard-write" style="width:100%;height:608px;display:block;padding:0;margin:0"></iframe> <a href="https://padlet.com?ref=embed" style="display:flex;align-items:center;gap:5px;flex-grow:0;margin:0;border:none;padding:0;text-decoration:none" target="_blank"><span aria-hidden style="color:#9E9E9E;font-size:10px;font-family:-apple-system,BlinkMacSystemFont,'Segoe UI',Roboto,Oxygen,Ubuntu,Cantarell,sans-serif;line-height:1">Made with<img src="https://padlet.net/emails/padlet_email_logo_2026_text-dark-200.png" height="12" style="padding:0;margin:0;background:0 0;border:none;box-shadow:none;display:block" alt="Made with Padlet"></a>

[H1:] Recalling your critical incident

avatar

[initially this should just display the 'thinking' text with a tiny rhythmic symbol (❋ thinking...). The user inputs text in the box below. It appears inline within this space]
[RUBRIC] Let's briefly reflect on your critical incident]
[Only ask 1 question per stage. Emphasise that the answers should be short.]
1. What happened?
Prompts: How did the situation progress? How did you feel? (e.g. initial gut reaction, changes in feeling as task progressed) How did you react? What choices did you have?
2. Analysis
Prompts: - Identify the positives; What was important to you? What skills/qualities/abilities did you use? Identify the things that could have gone better? What were the barriers to success? What needs improvement?
3. Making generalisations
Prompts: What conclusions can you draw from the experience? What have you learnt for the future? How does this relate to the real world?
4. Planning future actions
Prompts: What might you do differently? What risks might you take? What/who might help? What additional input might you need?

[USER INPUT]

avatar

[Rubric] Match the stages of Kolb's cycle with the correct description

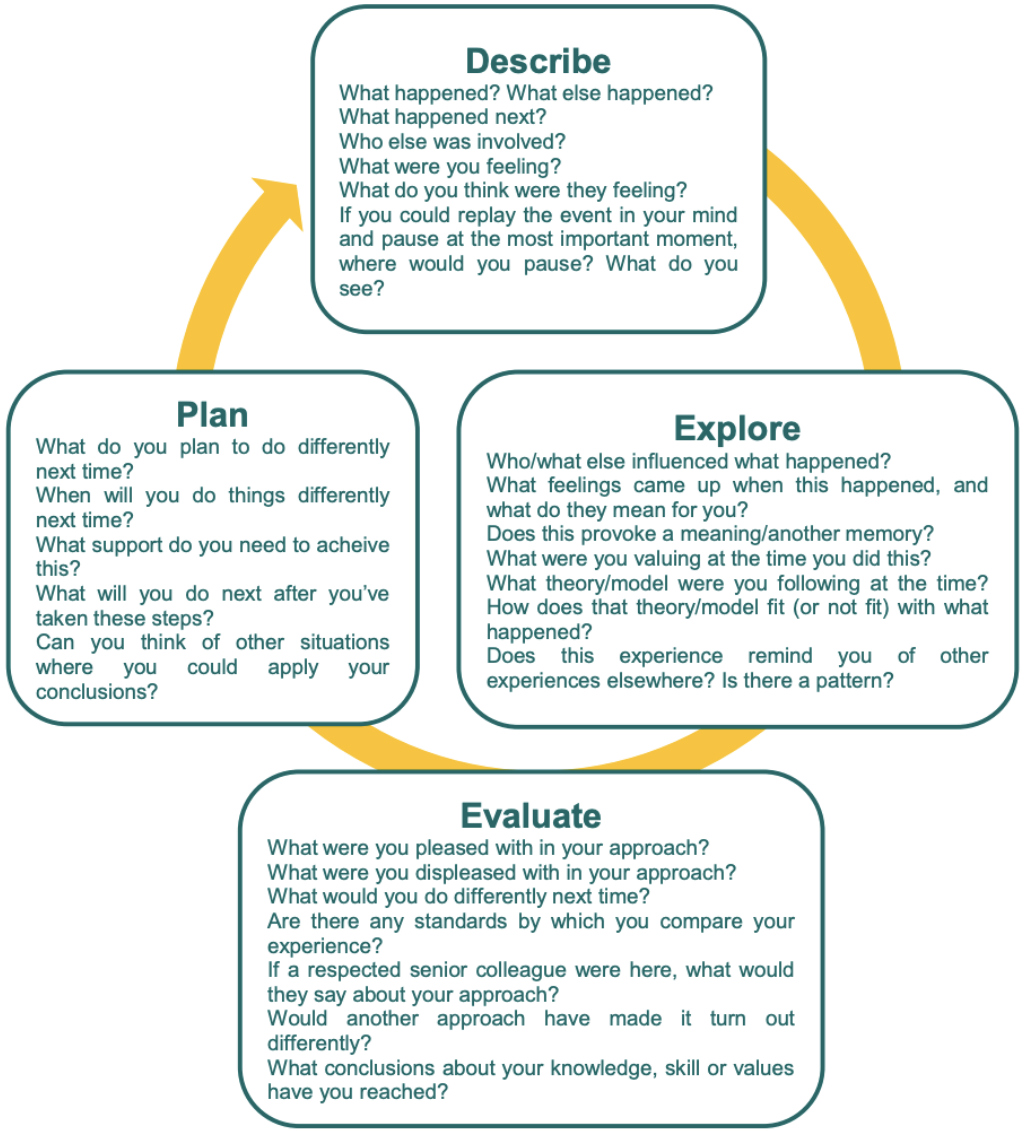
Display user reflection onscreen with Kolb phases in clearly demarcated sections

Drag and drop activity. Students drag these descriptors to the correct place

1) Here we focus on the facts of what happened.
2) Here, we plan for future action.
3) This is where we start to analyse the situation.
4) This is where we draw conclusions from the experience.

[Rubric] What other questions could we have asked during each phase

Text stll on screen. Now students will be presented with 8 questions (2 additional questions per phase) which they'll drag to the appropriate phase. Select questions from the image.
Don't label the questions wit the phase titles (CE, RO, AC, AE)



avatar

Place this inside a menu “click to review”

Concrete Experience - At this stage, the learner shows personal involvement with others in everyday situations. In concrete situations, learner tends to depend more on feelings, open-mindedness, and adaptivity to change, rather than on a systematic approach to situations and problems.
Reflective Observation - At this stage, learners understand situations and ideas from different points of view. They depend on objectivity, patience, and careful judgment but do not essentially take any action. The learners create an opinion on basis of their feelings and thoughts.
Abstract Conceptualization - At this stage, learners use ideas, logical approaches, and theories, rather than interpersonal issues or feelings, to understand situations or problems. In most cases, they depend on systematic planning and building ideas and theories to solve practical issues and problems.
Active Experimentation - At an active stage, the learners show an active learning experience by experimenting with different situations. At the active experimentation stage, the learners take a practical approach, rather than simply observing a situation.

[linking]
Display the user’s reflection text from slide 7
Student needs to link the phase descriptors to the correct phase of their reflection

avatar

[Rubric] Label each phase with the correct descriptor

[linking]
Display the user's reflection text from slide 7
Student needs to use a dropdown menu to determine whether a phase is Grasping knowledge or constructing knowledge

[USER INPUT]

avatar

[Quote card]Learning is the process whereby knowledge is created through the transformation of experience (Kolb1984, p. 26).

images/quote_card_Kolb.jpg

Short answer responses – user-chatbot dialogue

1. Have our class reflective processes been outcome oriented or process oriented?
2. Are they grounded in empirical or experimental facts or in experience?
3. Do we only analyse, or do we take different perspectives on a situation?
4. Can you give examples of thinking, feeling, perceiving and behaving from your reflection?
5. How has your immersion in the Haitian context changedlearning process, positively or negatively?
6. Can you give an example of a time when you learned a key lesson from your classroom experience on this programe?

Excellent work. In experiential learning, our focus is transforming our knowledge into experience. The whole process is governed by six principles

- Learning is best conceived of as an ongoing process, not in terms of outcomes.
    - Ideas are continually transformed through experience, which leads to further inquiry and skill in "knowledge getting" (p. 27).
- Learning is a continuous process grounded in experience.
    - Learning begins with examination and testing of beliefs and ideas, which are then taken up into a learner's belief system (p. 28).
- The process of learning requires the resolution of conflicts between different ways of being in the world
    - In the process of learning, one moves from actor to observer, and from specific involvement to general analysis(p. 31).
- Learning is an holistic process of adaptation to the world.
    - It brings together thinking, feeling, perceiving, and behaving.
- Learning involves interactions between the person and the environment.
    - Our internal experiences (e.g., of joy and happiness) interrelate with external or environmental experience (e.g., 20 years doing this job).
- Learning is the process of creating knowledge.
    - This is achieved through interaction between subjective life experiences and more objective human cultural experience

Now display this in a two tier menu. Present the first bullets (non indented) as a menu. Present the second bullets (indented) when user clicks on the menu item.

avatar

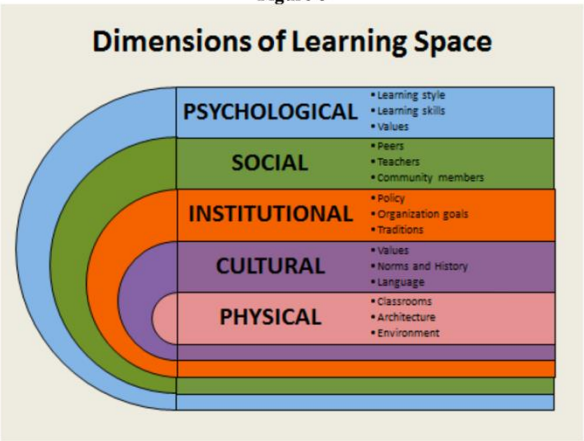
[Quote card] At the heart of the approach is the idea that the individual can manage his or her own learning through reflecting on experience and thereby be in control of self-development.(Vince 1998).

avatar

[Rubric] Label each phase with the correct descriptor

If learning is to occur, it requires a space for it to take place. While, for most, the concept of learning space first conjures up the image of the physical classroom environment, it is much broader and multi-dimensional. Dimensions of learning space include physical, cultural, institutional, social and psychological aspects (See Figure 6).

Figure 6



A systematic reflection should consider the learning space holistically.
Select one of the dimensions to discuss them in the context of your classroom.

The diagram should be interactive. Only display Psychological, social institutional etc. When the user taps one of thee, the subdivisions appear

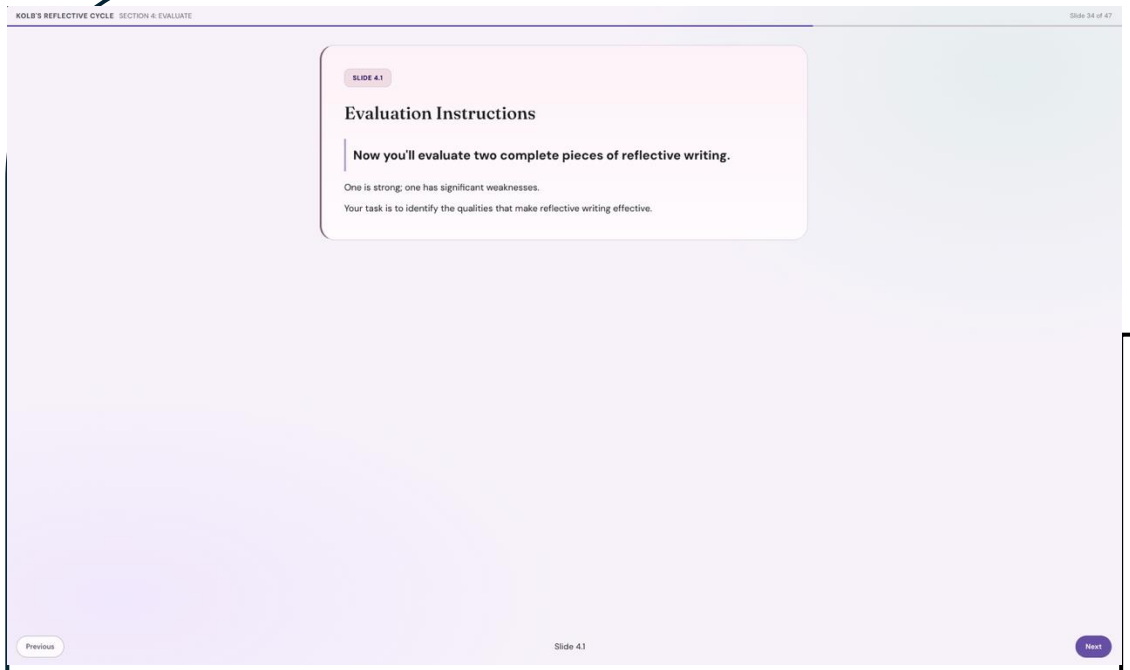
[USER INPUT]

avatar

H1 Title: Evaluating Reflective Writing

(use a Glassmorphism effect for this content panel)

images/title_background_image.jpg



Evaluation Instructions

Now you'll evaluate samples of reflective writing. This will help you to deepen your reflective practice and make it more systematic

1. Concrete experience: Immediacy and felt engagement

Assesses whether the reflection is grounded in a specific, lived experience and conveys the quality of direct, felt engagement that Kolb terms *apprehension* — knowing through immediate contact with the tangible qualities of the situation.

4 Strong

The reflection is anchored in a clearly identified experience. The writer conveys genuine immersion: sensory detail, affective response, and the felt texture of the moment are present. The event is specific enough in time, place, and circumstance to function as a concrete anchor for the rest of the cycle. The account reads as something lived through, not merely reported.

3 Secure

A definite experience is described with some felt quality and sufficient specificity, though the sense of immediacy or personal engagement is only partly developed.

2 Emerging

An experience is identifiable, but it reads as a factual summary rather than an account of something genuinely felt and inhabited. Specificity is thin.

1 Limited

The piece is vague, generalised, or abstract from the outset. No concrete, felt experience anchors the reflection.

Kolb (1984) defines concrete experience as the apprehension mode of grasping — direct, immediate engagement with the here-and-now, prior to conceptual interpretation. The learner must be "open, present, and willing to engage" (cf. the accommodative and divergent orientations, pp. 30–31, 68–69).

[rubric] read the excerpt and select an assessment grade

Last Tuesday, I taught our B1 class a lesson on the present perfect. We focused on using it to tell a friend about places they had visited. We use weak TBLT and during the input phase, students were slower than normal in responding and often gave very short disengaged responses. During the task phase I found students silent in their breakout rooms. Cameras were off, mics remained muted - or didn't, causing disruption. In the subsequent feedback session, I presented my onscreen whiteboard and asked students to annotate, but the response times had lengthened even further so as to make the activity unworkable.

.

Short answer. Students give their grade and write a ratinoale. AI should provide a rationale for the grade (4)

Corresponds to 3.2

2. Reflective observation: Deliberate, multiperspectival re-examination

Assesses whether the writer steps back from the experience and re-examines it carefully, attending to feelings, reactions, and outcomes, and considering the situation from more than one viewpoint.

4 Strong

The writer creates genuine reflective distance from the event. Observation is deliberate, patient, and meaning-seeking. Multiple perspectives are actively explored — the writer considers how others experienced the situation, entertains competing interpretations, or examines the event from standpoints beyond their own initial reaction. The multiperspectival quality deepens understanding rather than appearing as a list of viewpoints.

3 Secure

There is clear reflective distance. More than one perspective is acknowledged, though exploration of alternative viewpoints is not fully sustained or developed.

2 Emerging

Some reflection is present, but it remains close to immediate reaction or summary. Other perspectives may be mentioned but are not genuinely explored.

1 Limited

Little or no reflective observation; the writing jumps straight to conclusions or remains locked in a single, unreflected viewpoint.

Kolb (1984) defines reflective observation as the intentional mode of transformation — the learner "steps back" to examine experience through careful observation, "deliberately viewing things from different perspectives" (cf. pp. 30–31, 68). Multiperspectival examination is intrinsic to the definition of RO, not an addition to it.

Short answer. Students give their grade and write a ratinoale. AI should provide a rationale for the grade (4)

Drop down. The menu should contain the different phases

Include

The struggle for engagement left me feeling quite distressed.
I recall at the time, being highly self-critical, examining task design, lesson pacing, ICQs and feedback mechanisms. I observed that all these elements were adversely affected by learner disengagement. In particular, pacing suffered and no doubt, the decline in actionable feedback, the erratic pacing and unclear task parameters resulted in a negative feedback cycle.
During the lesson itself, the main locus of attention was on pedagogical quality so I leaned into my training, ensuring my ICQs and CCQs were focused and incisive; staging activities carefully; managing cognitive load by simplifying activities and scaffolding others. Sadly, these interventions didn't make an appreciable difference.

The exit survey surprised me however. I received detailed, engaged feedback, which opened up a route of inquiry I hadn't pursued. They were all saying much the same thing- the teacher needs to choose topics that are relevant and useful. During the lesson, one student had intimated that they didn't understand the topic. One of the most common responses was a slightly dismissive 'I don't know' and a few times, questions were met with an unmuted mic and sigh.

This all left a mark and I recall feeling deeply discouraged. The feedback was unilaterally and concertedly negative and, connecting this to previous experiences, there was an emergent pattern - I encountered the same reaction during a lesson on TOWIE, the students responded in much the same way and were, in fact, more outspoken about the irrelevance and utility of the topic. I had spoken to a colleague about this, and she mentioned that the same thing had happened to her when she started using an Oxford coursebook. The students rejected it out of hand she said and she promptly switched back to dogme style lessons, which she claimed they loved.

Abstract conceptualisation: Conceptual transformation

Assesses whether the experience is transformed into a principle, concept, or explanatory understanding through the mode Kolb terms *comprehension* — grasping experience through symbolic representation and logical analysis.

4 Strong

The writer derives a clear explanatory insight that genuinely grows out of the reflection. The conceptualisation goes beyond extracting a simple lesson: the writer integrates the experience into an existing framework, builds a new explanatory account, or recognises that a prior understanding must be revised (accommodation). Theory, research, general principles, or pattern recognition are used to make sense of the situation in a way that transforms understanding.

3 Secure

A plausible concept or explanatory framework is developed, though the conceptual transformation is somewhat narrow, under-elaborated, or applied rather than genuinely constructed from the experience.

2 Emerging

A lesson is stated, but it is obvious, generic, or weakly connected to the observed experience. Little genuine conceptual work is visible.

1 Limited

No meaningful conceptualisation is achieved. The writer does not move from observation to explanatory understanding.

Kolb (1984) defines abstract conceptualisation as the comprehension mode of grasping — creating meaning through symbolic representation, logical analysis, and systematic thinking (pp. 41–42). on Piaget, Kolb emphasises that mature conceptualisation involves both assimilation g experience through existing frameworks) and accommodation (revising frameworks in w experience) (pp. 23–25).

Short answer. Students give their grade and write a ratinoale. AI should provide a rationale for the grade (3)

Drop down. The menu should contain the different phases

Receiving the same feedback and reaction from two classes indicates that the topic focus should be the focus of my attention. Utility may indicate a lack of real world applicability and relevance may indicate materials that are outside learner experience. While both factors are important, I believe that the latter may be most pertinent here. As a western socially privileged teacher, I drew on what I knew and failed to situate the lesson in my learners' lifeworlds.

A lesson requiring them to talk about holidays and travels in a country devastated by natural disasters and armed violence was not context-sensitive. I was asking them to relate experiences they had little to no familiarity with - experiences which they aspired to have but which may have been unattainable. The lifestyles the lesson conjured up were ones of WASPish luxury and ease. Some activities for instance talked about 5 star hotels and luxury spa retreats. None of my students have travelled outside Haiti.

I would hypothesise that for students living under conditions of exceptional precarity marked by extremes of structural and personal violence, this may have brought home their lack of mobility and the constraints imposed upon them by the ongoing societal collapse, producing affective barriers to learning. This is supported when i triangulate evidence from my colleague and my previous lesson. In all three cases, the lesson content itself provoked a direct and marked reaction. I recognise that there are other possibilities, for instance, perceived pedagogical value or even teaching methodology - students may prefer dialogic, non-linear class types.

4. Active experimentation: Hypothesis-testing action

Assesses whether the writer turns conceptual learning into purposeful future action that has the character of an experiment — treating the planned action as a hypothesis to be tested against new experience.

4 Strong

The writer proposes a specific, context-sensitive next action that is clearly linked to the conceptual insight. The action is framed as something to be *tested* — the writer specifies what they will do, what they expect to happen, and how they will know whether it worked. The experimental quality is evident: the action is designed to generate new concrete experience that will feed back into the cycle.

3 Secure

A reasonable future action is proposed with clear links to the conceptual phase, though its experimental or testable quality is only partly developed.

2 Emerging

A vague intention is given without a clear course of action or any sense that the action will be treated as a test.

1 Limited

No meaningful experimentation is proposed, or the proposed action is disconnected from the preceding reflection and conceptualisation.

Kolb (1984) defines active experimentation as the extension mode of transformation — actively testing implications of concepts in new situations (pp. 30–31). This mode "involves a person in actively influencing people and changing situations" and emphasises "practical applications as opposed to reflective understanding" (p. 68). The key quality is treating action as hypothesis.

Short answer. Students give their grade and write a ratinoale. AI should provide a rationale for the grade (4)

My task for my next lesson then is to plan a class grounded in a Haitian cultural tradition, which draws on the lived experiences of the students in my class. I can draw on our needs analyses to inform the lesson content and also to help me to prepare alternatives and contingency materials. I will assess the efficacy of this intervention through exit surveys adapted to focus on materials and pre-lesson and then interpret the results post lesson. I will also run the materials by my colleagues. I will also continue to observe other factors to ensure that my diagnosis of the situation is correct. Peer observation will be useful here.

To inform my planning process I will send out questionnaires to get an initial sense of what my students value and conduct focus groups to get an even richer picture of what matters for them. This will be an ongoing process ad I will use the insights gleaned from the process to rethink materials design and classroom policy, shaping learning around my students and their needs

5. Integrity of the experiential cycle
Assesses whether the reflection enacts a genuine transformation of experience through the cycle, rather than listing stages formulaically.

4 Strong
The movement from experience through observation through conceptualisation to experimentation is coherent and cumulative. Each phase genuinely builds on the preceding one: observation grows out of what was experienced; conceptualisation grows out of what was observed; experimentation grows out of what was conceptualised. The whole is a process of knowledge creation, not a template-filling exercise.

3 Secure
Most transitions are clear and cumulative, though one link in the chain is weaker or more formulaic than the rest.

2 Emerging
The four phases are identifiable but loosely connected. The piece reads as four separate sections rather than a continuous transformation.

1 Limited
The phases are fragmented, confused, or mechanically listed without genuine connection.

Kolb (1984) defines learning as "the process whereby knowledge is created through the transformation of experience" (p. 38). The cycle is a recursive process of experiencing, reflecting, thinking, and acting in which each phase feeds the next. The integrity criterion assesses whether this transformative process is enacted, not merely performed.

Short answer. Students give their grade and write a ratinoale. AI should provide a rationale for the grade (3)
